PUBLISHED IN THE INTEREST OF BETTER SEEDS

Vol. 18 No. 1 CORNELI SEED COMPANY, 101 CHOUTEAU AVE., ST. LOUIS, MO. January 7, 1941

THE FIELD SEED SITUATION

The combined production of Alfalfa, Clover, Lespedeza and Timothy seed in 1940 was practically the same as in 1939. At the same time prices on all these items are lower than they were last year. With no major changes contemplated in the Soil Conservation Program and with agriculture generally in a reasonably healthy condition, we can expect as good or better a demand for clover and grass seeds than we experienced last year. The demand was held back last year on account of very unfavorable weather conditions prevailing throughout the early part of the Spring. A repetition of this condition can hardly be expected.

Lawn grasses, except imported items, such as Poa Trivialis and White Dutch Clover, are also as low or lower in price than last year. The building of new homes in suburban areas is expected to continue unabated throughout 1941, meaning an increased demand for lawn seeds.

We believe that all seed prices are very reasonable and advise taking advantage of this condition through early purchases.

VEGETABLE SEED SUPPLY IS
SHORT, SAYS DR. PAUL WORK

The supply of vegetable seed for planting in 1941 is materially reduced, more for some kinds than for others, says Professor Paul Work of the department of vegetable crops at Cornell University.

Cauliflower, spinach, carrots, onions, and radishes are the ones most seriously affected, and prices of these have advanced from 50 to 200 per cent compared with last year, he says.

“War in Europe, with imports cut off, and poor seed crops in the United States have caused the shortages. Increased export demand has helped to lift prices. No great increases in prices of peas, beans, sweet corn, cabbage, tomatoes, and the vine crops have yet been noted, but they may come later. However,” Professor Work said, “the price of seed is only a small part of the cost of growing most vegetable crops.”

“This country has usually obtained from Europe nearly all of its cauliflower seed, 90 per cent of its spinach, and from 35 to 45 per cent of the seeds of cabbage, radish, beet, onion, turnip, and rutabaga. The remainder is normally grown in the United States, and of course hold-over stocks are important.”

Vegetable growers, therefore, face a scarcity of several kinds of seeds and increased prices for many, he points out. The growers are urged to buy early and to watch quality closely, both as to germination and type. The best strains are likely to be taken first, and seedsmen say they will take care of their regular customers who come early.

Seed users will do well to test seed for germination, especially if it has been held for a year or two, Professor Work says. Special measures will help to get the most plants from a given amount of seed.

“In seed beds, thin sowing will yield a greater proportion of good plants. Careful preparation of seed beds, careful covering, use of water as needed, and full protection against insects and diseases will all help. Seed treatments are thus especially important.”

“While shortages are serious, there is no occasion for excitement or panic. Buy judiciously and use seed carefully,” is his advice.

“As to the future, this country can probably produce all it needs. There may be some adjustments, some inconveniences, and some price increases, but no grave threat exists of a serious cut-off of supplies.”
